

Application under test has two integration points, where a card payment is made from a merchant which sends transaction information that includes mandatory fields (Cust Id, Tran Id, Tran Amount and Merchant Id) to Integration layer through MQ. Integration Layer gets enrichment data (Cust DOB, Cust Post Code, Merchnat Post Code) from DW through multiple feeds for this transaction. Integration Layer then transforms the request with enrichment data to a format accepted by Fraud Decisioning Engine through tcp. Response from the decisioning engine will be sent back to payment system through Integration Layer.

Test Condition

Payment declined if any below true:
 Customer minor and amountt > \$5000
 Cust post code unkown and amount > \$10000
 If DOB unknown, treat as adult

All above and a new rule
 Declined if Merchant is outside NSW
 and amount > \$20000
